

1 COMFORT ENHANCER FOR A BREATHING APPARATUS

2
3 BACKGROUND OF THE INVENTION

4
5 FIELD OF THE INVENTION

6 This invention relates to the field of breathing disorders
7 and, more particularly, to apparatus used to treat sleep apnea.
8 However, the invention relates to any tubular supply device for
9 bedridden patients.

10
11 DESCRIPTION OF THE PRIOR ART

12 The use of positive pressure respirators to treat sleep apnea is
13 known, as taught by Hansen et al, U. S. Patent No. 6,516,802, which
14 discloses a device to control a hose in a CPAP system.

15 A product on the market is the, "EZZZ SWING," Bedside Awing Arm,
16 Part No. QA01, Quality of Life, Inc. of Minnetrista, MN, which has a
17 post mounted on a bed and a gooseneck near the top with a Velcro tab
18 to secure the air hose.

19 The problem of maintaining an open breathing line and minimizing
20 the stress on the mask and the wearer's head has been addressed in
21 other prior art patents, for example, Koncsek, U. S. Patent No.
22 5,836,361, Harmon, U. S. Patent No. 5,279,486, and Dvorachek, U. S.
23 Patent No. 4,238,096 with varying degrees of success.

24 What is needed in the art is a low cost, simple support system

Express Mail Label No. EV 446308451 US

1 that can be easily assembled and disassembled for travel and provides
2 a variable position for the mask without becoming entangled with the
3 user or the bedclothes.

4 5 SUMMARY OF THE PRESENT INVENTION

6 Therefore, an objective of this invention is to provide a
7 system for treating sleep apnea that removes the breathing hose
8 from contact with the user and the bed while providing a variable
9 position for the hose to compensate for movement of the user.

10 It is another objective of this invention to provide a
11 support post and cantilever arm coupled by a spring biased pulley
12 to control the position of the hose.

13 It is a further objective of this invention to provide the
14 components with structure permitting manual assembly and
15 disassembly without the use of tools. The components are also
16 formed to be reduced in size for ease of packing.

17 18 SHORT DESCRIPTION OF THE DRAWINGS

19 Fig. 1 is a side view of the assembled support of this
20 invention without the air hose;

21 Fig. 2 front view of the support of this invention;

22 Fig. 3 is a back view of the support of this invention;

1 Fig. 4 is a top view of the base of the support of this
2 invention;

3 Fig. 5 is a side view of the base with a leg of this
4 invention;

5 Fig. 6 is a top view of a hose clamp of this invention; and

6 Fig. 7 is a top view of a storage stay of this invention.

7
8 DETAILED DESCRIPTION OF THE INVENTION

9 A CPAP machine is normally placed near the user's bed and a
10 length of breathing hose extends from the machine to a mask worn
11 by the user while asleep. The breathing hose has sufficient
12 length to allow for movement of the wearer during the night
13 however, the hose has a tendency to become entangled in the
14 bedclothes and wrap around the wearer.

15 The comfort enhancer 10, shown in Fig. 1, provides flexible
16 support for the breathing hose of a CPAP machine (not shown). A
17 support post 11 is spaced laterally from a bed and extends
18 perpendicularly above the bed to a height to clear the normal
19 turning of a sleeping wearer. The support post may be in
20 separate sections 12 and 13, as shown, with male 14 and female 15
21 fittings or a telescoping tube or hinged. A hose clamp 50 is
22 slidably mounted on the support post. In Fig. 2, a hose clamp
23 collar 55 is frictionally mounted on the support post. The

1 position of the hose clamp 50 may be adjusted by moving the hose
2 clamp collar 55 to the desired location. The top end 16 of the
3 post is connected to a bracket 17 by inserting the end into a
4 cavity 18. The end 16 is secured to the bracket by a set screw
5 19 threaded through the wall of the cavity and contacting the end
6 of the post.

7 The bracket 17 is composed of two parallel planar sides 20
8 and 21 connected by an axle 22 and a rectangular insert 23. The
9 edge 24 of the insert has a threaded hole for the set screw 19
10 and a threaded hole for the spring screw 25, as shown in Fig. 3.
11 The sides of the insert are attached to the bracket by screws 26
12 and 27. The top end of the insert 23 has a bore 60 for insertion
13 of the coil spring 30. The bottom end of the insert has a bore
14 61 for insertion of the support post 11.

15 A pulley 28 is rotatably mounted on the axle 22. A spring
16 retainer is fixed to the circumference of the pulley by screw 29.
17 A coil spring 30 extends from the spring screw on the bracket to
18 the spring retainer on the pulley 28. The coil spring 30
19 maintains a spring bias on the rotation of the pulley 28 to
20 return to its original position after rotation. The pulley 28
21 has a pin stop 31 on one side to engage the bracket 17 in the
22 original position and limit spring biased return rotation. The
23 spring bias may be generated by other types of springs acting
24 between the pulley and the bracket. The spring tension generated

1 by the rotation of the pulley need not be high but enough to
2 prevent slack in the breathing tube.

3 A cantilever arm 32 is attached at one end 33 about the
4 circumference of the pulley 28, as shown in Fig. 2, to extend
5 generally normal to the support post 11 and parallel to the bed
6 above the sleeping user. A hose clamp 50 and hose clamp support
7 56 are slidably connected to the arm to initially adjust the hose
8 toward the vertical between the mask and the hose clamp. In this
9 manner, the weight of the hose is compensated for by the spring
10 bias on the pulley which is transferred to the cantilever arm 32.
11 The arm may be one piece, hinged, telescoping tubes, or sections
12 connected by male, female joints.

13 When the wearer rolls or moves his head away from the post
14 11, the lever arm 32 will move vertically downwardly and, if
15 necessary, the bracket 17 will rotate on the support post 11 to
16 relieve tension on the hose. As the wearer moves back toward the
17 post, the arm will move upwardly in response to the spring bias
18 to remove slack from the hose.

19 The comfort enhancer 10 has a base 34, shown in Fig. 4, that is
20 preferably placed between the mattress and the springs of the bed
21 but may sit on the floor or a table. The base has an aperture 35
22 and is slidable along the support post 11. The base 34 has a
23 thumbscrew 60 threaded into the aperture 35 to secure the base to
24 the post at the proper height. The base 34 has a bi-pod fixture

1 36 with a V-shaped passageway to receive two intersecting base
2 legs 37 and 38. The legs 37 and 38 provide stability to the
3 support by increasing the lever arm necessary to pivot the
4 support post. Each passageway has a thumbscrew 39 and 40 to
5 secure the legs to the base. The legs may be one piece, or
6 telescoping tubes, or hinged, or sections connected by male
7 female joints.

8 The hose clamps 50 have an aperture 51 in one end for
9 insertion of the support post 11 or the cantilever arm 32. The
10 other end of the clamp is formed with two resilient arms 52 and
11 53 for frictionally holding the breathing tube. The open arms
12 allows the hose to separate from the clamps in the event of a
13 sudden and/or forceful pull on the hose.

14 The comfort enhancer is designed to be collapsible for ease
15 in traveling and storage. The components may be assembled and
16 disassembled by hand. Several storage stays 54 can be included.
17 The stays have an elongated flat body with apertures 57 and 58 in
18 each end. One stay is slidably mounted on support post 12 by
19 aperture 57. The disassembled support post and cantilever arm
20 may be linked together by inserting the cantilever arm in the
21 aperture 58 of the stay to minimize space requirements.

22 A number of embodiments of the present invention have been
23 described. Nevertheless, it will be understood that various
24 modifications may be made without departing from the spirit and

1 scope of the invention. Accordingly, it is to be understood that
2 the invention is not to be limited by the specific illustrated
3 embodiment but only by the scope of the appended claims.
